WOOD'S CROP SPECIAL

Giving Timely Information and Prices of Seasonable Seeds

PUBLISHED BY T. W. WOOD & SONS SEEDSMEN RICHMOND VA.

VOL. XVI.

SEPTEMBER EDITION

1921

Our "Wood's Crop Special" is issued monthly during planting seasons. There is no subscription price, but is mailed free upon request. If any of our customers do not receive Wood's Crop Special regularly, and desire to do so, advise us and we will place your name on our regular mailing list.

SEASONABLE NOTES

The very unusual dry spell that has prevailed throughout practically the whole world has caused untold damage to growing crops, and there is every indication for higher values very soon on what the farm produces. Optimism is once again on the lips of the Southern farmer, and with both cotton and tobacco showing an upturn we can look to the future for much better and more prosperous times than we have experienced in the past twelve months. Our Southern farmers should take advantage of this opportunity now, and put in all available lands to crops that will pay dividends. Keep the land in a high state of cultivation by sowing **Crimson Clover** or **Vetch**, both of which are excellent soil improving and grazing crops.

With seasonable rains in the Southern States we look for an unprecedented demand for **Crimson Clover**, **Vetch**, and all seeds for fall planting. Prices at which **Crimson Clover** and **Vetch** are now being sold are far below replacement value, which is due to the light demand, but with seasonable rains you can look for heavy advances on both of these items. We very strongly recommend to our customers early purchases of their fall seed requirements, as we firmly believe that there will be a considerable saving to them.

Our **New Fall Catalog** gives the most up-to-date information regarding both field and garden crops. If you have not received a copy, write for it today. Free upon request.

Abruzzi Rye continues in popularity throughout the costal section of the Southern States. Its earliness and stooling qualities place it far ahead of the ordinary Winter Rye for grazing purposes.

The **Fulghum Oat** is rapidly becoming the standard variety for the eastern section of the South Atlantic States. Its productiveness and early maturity has given it preference over other fall sown oats, being ready to cut just ahead of wheat harvest.

For the mountainous districts the **Virginia Gray Winter** or **Turf Oat** is preferable on account of its extreme hardiness. Its stooling qualities are excellent, and the yield of grain is larger than that of any other fall sown oat.

The **Appler** and **Red Rust Proof** are also very satisfactory and large yielding kinds, giving heavy yields of grain all through this and the Southern States.

CRIMSON CLOVER

For the Middle Atlantic and Southeastern States there is no better crop that can be sown this month for forage, green manure or winter cover crop. It is of special value as a green manure crop to increase the humus and nitrogen content of the soil upon which it is produced. The really remarkable soil improvement resulting from the use of **Crimson Clover**, makes it very desirable that as large an area as possible be seeded to this leguminous crop. Instances are not rare where the yields of corn have been increased from 10 to 70 bushels per acre by the use of this valuable legume in rotation.

For dairymen and cattle raisers, **Crimson Clover** is indispensable, both for its value as a winter and spring grazing crop and for early green food.

September is generally considered the best time for sowing **Crimson Clover**, as there are more frequent rains and less danger of the stand being damaged by hot, dry spells. It can be grown successfully on almost any type of soil that is well drained and supplied with organic matter. The seed bed should be well and thoroughly prepared, having the soil firm, moist and well settled. This can be best obtained by plowing the land about two or three weeks before sowing and then harrowing and cross harrowing at intervals. Immediately after a good rain run the harrow over the field and sow the seed, covering lightly with a brush harrow.

SEED WHEAT

All of our seed stocks of Wheat are especially drawn from sections that were not affected by blight, and from crops yielding as high as 25 to 35 bushels per acre. All are carefully re-cleaned to remove any impurities and small or inferior grains, and are decidedly superior to ordinary seed stocks being offered at low prices. Our seed stocks in actual test show a purity of over 99% and germination over 95%.

We can offer **Leap's Prolific** and **Stoner Wheats** grown in both the Shenandoah Valley and Piedmont sections. The Shenandoah wheat was grown on limestone land, having an unusual large, plump berry.

Samples of all varieties of wheat will be cheerfully sent free upon request. Be sure and inspect these samples before securing your seed requirements.

WOOD'S CROP SPECIAL.

ALFALFA FOR THE SOUTH

We can now supply our customers with the regular **Alfalfa** and the **Hairy Peruvian Alfalfa**, both American grown. The **Hairy Peruvian** is especially adapted to sowing in the southern section of South Carolina, Georgia, and other Gulf States, where long growing seasons are available. It not only matures in a shorter time than the regular alfalfa, but also makes more growth during the winter months, thereby furnishing earlier and larger quantities of both hay and pasturage. The increased yield per season, covering actual tests of several years, averages about three-quarters of a ton per acre over the regular alfalfa, which is due to the longer growing season. It is characterized by rapid growth, quick recovery after cutting, and ability to grow in cooler weather than the regular alfalfa, although not adapted to sections where the winter temperature falls below 10 degrees Fahrenheit. For low lying lands in the above sections we can unhesitatingly recommend the **Hairy Peruvian Alfalfa**.

For North Carolina, Virginia, and more northerly sections, the regular alfalfa is by far superior, as it is hardier and will not winter kill in colder climates.

The **Grim Alfalfa** is the hardiest of all the varieties of alfalfa, and is especially adapted to cold climates or mountainous districts. The Grim, in tests made at our experimental farm, has proven superior to other varieties in yield and ability to withstand extreme cold weather.

The best time for sowing alfalfa is during September, and we strongly recommend liberal seedings on account of the probable scarcity of hay, due to the drought that has extended over practically the entire Southern States.

Full information regarding preparation of soil, seeding, etc., given on page 3 of our Fall Catalog.

HAIRY VETCH (*Vicia Villosa*)

It is the hardiest variety of the Vetch family and better adapted to sowing in Virginia, North Carolina, and Northern States. Vetch is high in protein and furnishes an excellent pasturage, hay and soiling crop, greatly improving the land by adding nitrogen and organic matter to the soil. Actual tests have shown that cow pea hay contains approximately only four-fifths as much nitrogen as a ton of vetch hay, so it can be readily seen what wonderful soil improving properties Vetch contains. The value of Vetch is being rapidly appreciated by our Southern farmers, and is being used to a larger extent every year. It has a much longer planting season than Crimson Clover, as it can be satisfactorily sown from August until September.

On account of its reclining growth, it is advisable to sow with oats for support, at the rate of 25 pounds of Vetch with three-fourth bushel of oats to the acre. Can also be satisfactorily seeded with rye, barley or wheat, but when planted with oats, the vetch can more easily be separated from the oats. It is considered that vetch and oats make a better crop of hay.

Oregon Vetch (*Vicia Sativa*) is not quite so hardy as the Hairy Vetch, and only recommended for sowing in South Carolina, Georgia and the Gulf States. It is of more upright growth and has a wider and smoother leaf, and consequently is more desirable for a hay crop in the extreme Southern States.

WOOD'S GRAIN PASTURE MIXTURE

For a quick growing, one season pasture it is unsurpassed. Contains the best grazing varieties of Winter Rye, Wheat, Barley, Turf Oats, Rape and Vetch, and is highly recommended for pasturage during fall, winter, spring and early summer. A very economical mixture to sow for quick returns.

SOW LAWN GRASS IN SEPTEMBER

This summer has been unusually severe on lawns, and seeding this fall is advisable for a good green appearance the coming winter and spring. As soon after a good rain as possible, carefully rake the soil and sow **Wood's Evergreen Lawn Grass**. An application of Bone Meal will aid materially towards a better stand.

Our **Wood's Evergreen Lawn Grass** is composed of only the finest growing turf grasses, and is especially adapted to sowing on lawns where special care and attention can be given. **Wood's Permanent Lawn Grass**, a mixture of more robust growing grasses, is especially prepared for parks or large places where special care cannot be given.

WOOD'S SPECIAL GRASS AND CLOVER MIXTURES

These mixtures are composed of only the very best seeds, all of Wood's Trade Mark Brand quality. They contain from 9 to 13 different varieties of grasses and clovers, mixed in proper proportion for soils to which they are recommended, and have given the best of satisfaction wherever used. They have an enviable reputation for furnishing an abundance of hay and excellent grazing where the sowing of only one or two grasses have failed. The increased number of orders that we receive every season for our **Special Mixtures** is evidence that they give the largest yields of hay and pasturage.

We have especially prepared from our own experience five mixtures for permanent pasture and four for mowing for hay, put up for different types of soil. Full information is given on pages 6 and 7 of our New Fall Catalog.

Any of our customers who have any special formulas for mixtures of grasses and clovers, which they expect to put in this fall, we shall be pleased to quote prices on their requirements, either mixed or separately. We make no charge for mixing grasses and clovers for our customers.

GRAIN PURCHASES THIS FALL

Special care should be taken this year in purchasing grain for seed, which includes **Wheat, Oats, and Rye**. The very unfavorable weather during the growing seasons has had its effect on these crops this year, and consequently the bulk of grain offered is light in weight and from crops of small yields. This condition will naturally cause a large quantity of light weight grain to be offered on our markets at low prices. Grain of this quality is unfit for seed purposes, and if planted will affect the yield to a very large extent.

We are drawing our supplies of seed grain from localities that did not suffer from the above condition, and our customers, when buying **Wood's Trade Mark Brand Seeds**, can rely on their quality being the best re-cleaned stock available. A comparison of our samples will convince you that our prices are low when quality is considered.

Barley is considered a stronger and more nutritious feed than rye, and makes one of the best winter cover and pasture crops, as well as furnishing excellent yields of grain. We can supply the **Winter Bearded Barley** or the **Arlington Beardless Barley**, both well suited for sowing in Virginia and the Southern States.

FERTILIZERS FOR FALL GRAIN CROPS

"In spite of the low prices of farm crops it still pays to use fertilizer on a crop like wheat."

This is the opinion of the Missouri Agricultural College, and we are in agreement with it.

Fertilizer prices are very much lower than they were a year ago, and it will certainly pay the farmer in increased yield to use fertilizers this fall both for wheat and other grain crops.

Bone Meal is now greatly under last fall's prices, at which time there was a restricted use on account of the high price. All wheat growers know the value of **Bone Meal**, either drilled or broadcast. We offer this fertilizer at a price lower than we have been able to do for several years.

We are also able to offer **16% Acid Phosphate** at a price under last year's figures. As it is well known, **16% Acid Phosphate** is frequently used in combination with **Bone Meal** for a wheat fertilizer, and on account of favorable prices this fall we recommend the use of this in connection with our **Steamed Bone Meal**.

If a mixed fertilizer is desired for wheat we call attention to our **Wheat Fertilizer, 1-21-10-1**, or our **Standard Grain and Grass Fertilizer, 2-8½-2**. See prices in this **Crop Special**, and extended description in our Fall Catalog.

"Best Mixture Ever Used."

It gives me much pleasure to say that I have used your No. 7 Grass Mixture for a number of years, and have about thirty acres in it already. It is the best mixture I have ever used, and I have never failed to have a fine hay crop.—G. B. RIVES, Albemarle County, Va., June 14, 1921.

WOOD'S CROP SPECIAL.

Prices of Field Seeds are always subject to market fluctuations. We always fill all orders entrusted to us at lowest ruling prices on date order is received. If prices decline, we give our customers the benefit of it. If they advance, we charge the advance prices. In case customers desire to limit us to filling orders at prices quoted on any particular date, they will kindly so state on order. Mention date and number of "Wood's Crop Special" upon which the order is sent.

Terms on all Field Seeds, net cash. Customers who have no regular accounts with us will kindly remit the amount with their order or name business reference as customary before opening accounts.

While we exercise great care to have all seeds pure and reliable, we give no warranty, express or implied, as to description, quality, productiveness, or any other matter connected with the goods we send out, and will not be in any way responsible for the crop. Every order for articles named in this rice-list will be executed on these conditions only.

SEED WHEAT

All of our seed stocks are especially drawn from sections that were not affected by blight and from crops yielding from 25 to 35 bushels per acre.

Carefully recleaned and sacked in even weight new 2½ bushel sacks.

Beardless Varieties:	25-bus. lots, per bus.	10-bus. lots, per bus.	Per bus.
Leap's Prolific	\$2.25	\$2.30	\$2.35

GOLF GRASSES

We have recently added to our business a Special "Golf Department." This department is in charge of experts of many years' experience and who are thoroughly conversant with all the requirements of the game, and also familiar with conditions applying to Golf Courses in the Southern States.

Inquiries addressed to our Golf Department will receive prompt attention. We also have in stock very fine qualities of grass seed for both fairways and putting greens which we offer at the following attractive prices:

Wood's Special Fair Green Mix- ture for Southern Courses (contains Bermuda Grass) ..	100-lb. lots, per lb.	50-lb. lots, per lb.	10-lb. lots, per lb.
